

Terminal selection is established on output form; this pool leaves content-sensitivity open

The endpoint clears its exact null decisively; two thirds of the informative groups are won by avoiding a non-committing candidate.
The content question is resolved by the all-well-formed pool (§8.6).

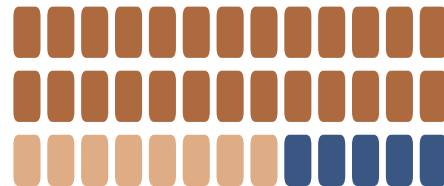

A Selection beats matched random

39 informative heldout groups · exact Poisson-binomial null

B What decides each group

one cell per group · no malformed candidate is ever scored correct

- 26 malformed-avoidance alone suffices
- 8 malformed present, plus a well-formed wrong candidate
- 5 pure content-quality choice

Content-only: 5/5 vs 3.75 expected — suggestive, underpowered
